

The Timeline of **Radioactive Decay for Uranium²³⁸ (U²³⁸)**

A Factfile provided by the Institution of **Engineering and Technology**

About This Factfile

The Institution of Engineering and Technology acts as a voice for the engineering and technology professions by providing independent, reliable and factual information to the public and policy makers. This Factfile aims to provide an accessible guide to current technologies and scientific facts of interest to the public.

For more Position Statements and Factfiles on engineering and technology topics please visit <http://www.theiet.org/factfiles>.

The Institution of Engineering and Technology

The Institution of Engineering and Technology (IET) is a global organisation, with over 150,000 members representing a vast range of engineering and technology fields. Our primary aims are to provide a global knowledge network promoting the exchange of ideas and enhance the positive role of science, engineering and technology between business, academia, governments and professional bodies; and to address challenges that face society in the future.

As engineering and technology become increasingly interdisciplinary, global and inclusive, the Institution of Engineering and Technology reflects that progression and welcomes involvement from, and communication between, all sectors of science, engineering and technology.

The Institution of Engineering and Technology is a not for profit organisation, registered as a charity in the UK.

Summary

This Factsheet shows the radioactive decay chain of uranium²³⁸, the resulting products, the radiation emitted in the process and the timescales involved.

Uranium²³⁸ (U²³⁸) Radioactive Decay

Type of Radiation ⁽²⁾ (α , β , γ)		Nuclide	Half-Life
		Uranium ²³⁸ ⁽³⁾	4.47 billion years ⁽¹⁾
α γ		Thorium ²³⁴	24.1 days
β γ		Protactinium ^{234m}	1.17 minutes
β γ		Uranium ²³⁴	245000 years
α γ		Thorium ²³⁰	80000 years
α γ		Radium ²²⁶	1600 years
α γ		Radon ²²²	3.823 days
α		Polonium ²¹⁸	3.05 minutes
α β		Lead ²¹⁴	26.8 minutes
β γ		Bismuth ²¹⁴	19.7 minutes
α β γ		Polonium ²¹⁴	0.000164 seconds
α		Lead ²¹⁰	22.3 years
β γ		Bismuth ²¹⁰	5.01 days
α β		Polonium ²¹⁰	138.4 days
α γ		Lead ²⁰⁶	stable

α – Alpha Radiation
 β – Beta Radiation
 γ – Gamma Radiation

Notes

1. The half-life of Uranium²³⁸ is 4.47 billion years. Given that the estimated age of the Earth is also about 4.5 billion years, in this time period, about half of the Uranium present when the Earth was formed has decayed and about half still exists today.

2. Radioactivity is the emission of particles or electromagnetic energy from the nucleus of an atom. The three types of radioactive decay are alpha (α), beta (β) and gamma (γ).

Alpha particles are helium nuclei each made up of two protons and two neutrons.

Taking the example:

the daughter nucleide, Thorium has two fewer protons and two fewer neutrons than the parent nucleide.

Beta particles are electrons, the mass of which are negligible on the atomic weight scale. In beta emissions, the parent and daughter elements have virtually the same atomic weights.

Gamma rays are very high frequency electromagnetic radiation emitted in many radioactive changes irrespective of whether alpha or beta particles are emitted.

3. Uranium²³⁸ is also fertile in that it can capture a neutron transforming, following radioactive decay, into Plutonium which is fissile and can be used as fuel in a nuclear reactor.
